Our NEW Organic Fertiliser for 2011

LOOK WHAT OUR GRO-POWER SPRING FERTILISER CAN DO FOR YOU!

- GRO-POWER breaks up compacted and heavy soils.
- GRO-POWER develops better root structures.
- GRO-POWER feeds the bacterial life in the soil to promote better assimilation of plant food.
- GRO-POWER promotes healthier and more abundant plant and turf.
- GRO-POWER contains humus to increase the moisture holding capacity of the soil.
- GRO-POWER contains humic acids and bacteria which aid in unlocking the nutrients and other elements that have become locked in the soil.
- GRO-POWER produces a healthier soil, which aids in eliminating many diseases of the roots and plants.

Organic Fertiliser

What is it?

“Spring Premium Green” fertiliser is a unique homogeneous fertiliser/soil conditioner and was developed in the USA originally for greens, tees, fairways and stadiums. The nitrogen source formulation is readily available for fast uptake by the turf and phosphorus is added to ensure deep healthy roots. The potassium provides increase disease resistance, and a long lasting, non-staining iron has been added to help produce a dark green colour. A soil penetrant is also included to maximize water percolation into the soil profile.

What's the difference?

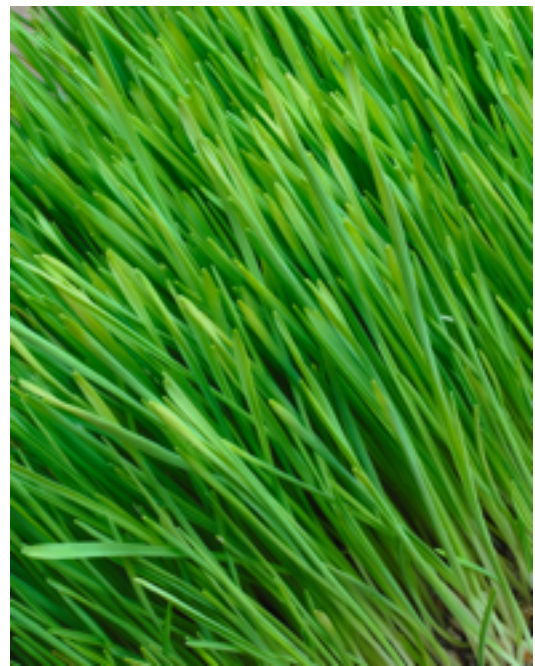

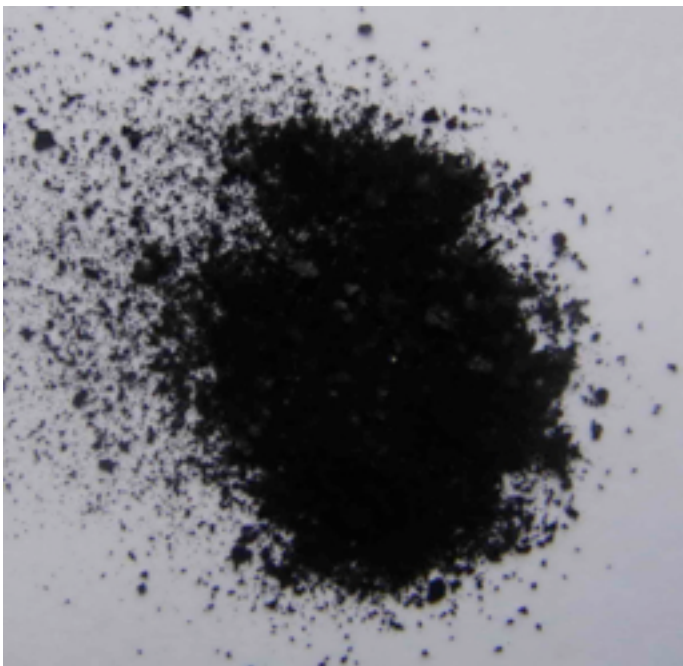

The basic material is Humus. This promotes bacterial propagation which improves soil structure, unlocks naturally occurring nutrients in the soil, breaking down clay, compacted soils, helping sandy soils retain moisture and nutrients and encouraging natural breakdown of thatch. This product contains 70% Humus for maximum effect to start changing the soil on a long term basis. The Humic acid included reacts with the soil to help condition it and produce an environment in which the plant can receive maximum results. So we are not only making the grass green but actually improving the whole lawn profile!

Anything else?

Unlike most other organic fertiliser, we guarantee there is no chlorides, sewage, sludge, animal or poultry manure. The work is done by the Humus.

You will notice is that you can hardly see it unlike our usual fertiliser. It is tiny black pellets.

This is what the fertiliser looks like:

Your secret ingredient for a beautiful lawn
